Decision Radar | Team Details

- Team name: GeminiMaxxing
- Team leader name: Mike Umali
- Category/theme: Future of Work & Enterprise Productivity
- Problem statement: Teams miss updates that invalidate decisions and affect downstream plans

Brief about the idea

Know before it breaks.

Project decisions outlive the assumptions behind them. Vendor dates, budgets and status change across documents and meetings.

Decision Radar uses Gemini to extract evidence, flags conflicts with confirmed assumptions, and shows which plans may need review.

62%

of surveyed workers struggle with too much time spent searching for information.

Microsoft Work Trend Index 2023

31,000 respondents; 31 markets

Source: Microsoft, “Will AI Fix Work?” (2023). Benefits are intended; customer gains are not yet measured.

Opportunities

- Monitors confirmed decisions and their assumptions over time.
- Connects changed evidence to the affected decision and its dependencies.
- Exact source quotes, typed rules and a recorded human response.

For project teams

Find changed assumptions sooner.

Reduce manual evidence gathering.

Support handovers with preserved rationale.

For accountable decisions

Separate direct evidence from projected effects.

Inspect incomplete evidence coverage.

Retain review rationale and audit history.

Theme: Future of Work & Enterprise Productivity. Productivity and adoption need a customer pilot.

List of features offered by the solution

Connect and understand

Drive intake: Docs, TXT and saved transcripts; tables with explicit mappings.

Gemini: structured fact candidates, verified against exact source quotes.

Decision register: human-confirmed assumptions and preserved rationale.

Assess and act

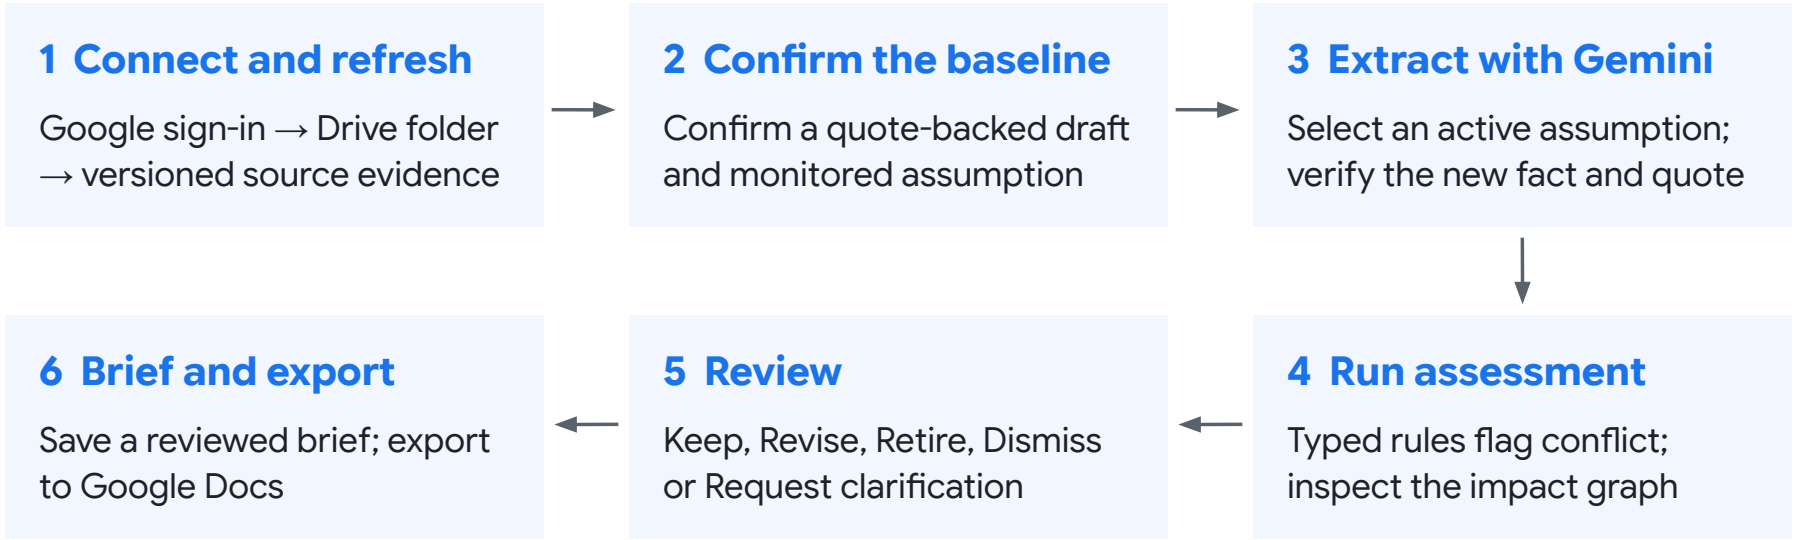

Typed assessment: date, decimal and enum rules with visible coverage.

Impact graph: challenged decision and recorded downstream dependencies.

Five review actions, audit history, fixed briefs and explicit Docs export.

Drive refresh is manual; generated Meet transcripts use a separate event-driven intake path.

Process flow diagram or Use-case diagram

Example: delivery assumed by 15 October; confirmed update 24 October → nine-day contradiction.

Wireframes/Mock diagrams of the proposed solution (optional)

Architecture diagram of the proposed solution

Shared state: Firestore | Immutable snapshots: Cloud Storage | Tokens: Secret Manager

Cloud Run: asia-southeast1. Meet events: Workspace Events → Pub/Sub; Scheduler renews subscriptions.

Technologies to be used in the solution

Google Cloud and Workspace

Vertex AI + Google Gen AI SDK

Gemini 2.5 Flash (configurable default)

Cloud Run, Cloud Tasks and Firebase Auth

Firestore, Cloud Storage, Secret Manager

Drive, Sheets, Meet and Docs APIs

Workspace Events, Pub/Sub, Scheduler

Application and trust controls

Next.js, React, TypeScript, React Flow

Python, FastAPI and Pydantic

Schema-constrained JSON extraction

Exact quote-to-snapshot verification

Deterministic typed comparison

Human review and revision checks

Source documents are read as evidence. Exports create separate Docs; decisions require human action.

Estimated implementation cost (optional)

Cost model for a small pilot

AI: input/output tokens per fresh extraction.

Compute: Cloud Run request time and memory.

State: Firestore operations and snapshot storage.

Delivery: task, event, scheduler and secret operations.

Unchanged verified inputs reuse results. Stateless services scale independently; queues absorb bursts.

Estimate status

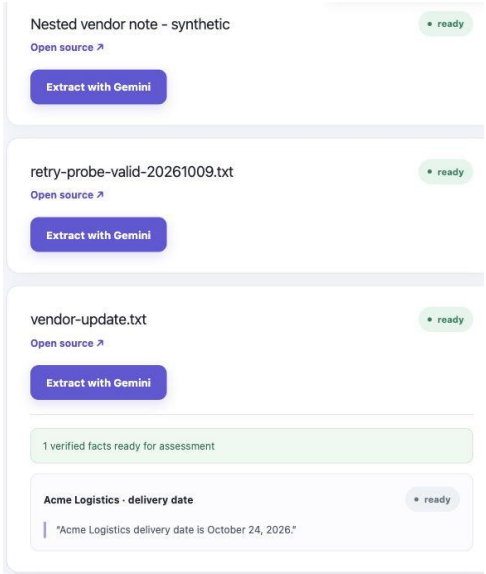

No measured per-team operating cost yet.

Pilot budget needs document volume, tokens, job rate and retention.

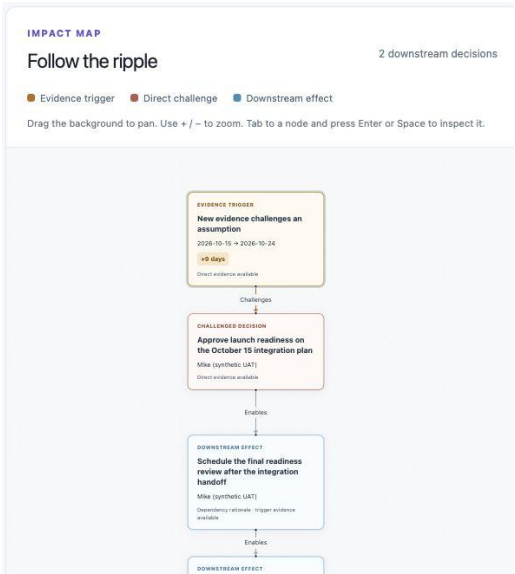

No production cost or savings claim. Validate usage and billing during the pilot.

Snapshots of the prototype

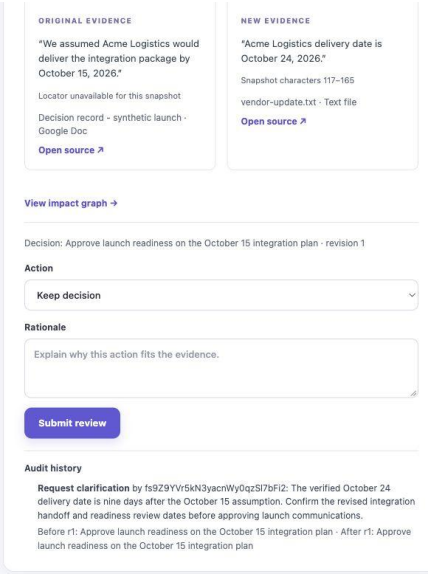

Verified fact

Impact graph

Review audit

Deployed synthetic rehearsal screenshots, 10 October. Current full staging runs: 17 October.

Prototype Performance report/Benchmarking

Observed on staging

Two fresh full deployed runs through actual Google Docs export reported on 17 October.

About 9 s to a verified Gemini fact.

About 16 s for background assessment.

Timings are single observations, not p95.

Recovery and quality

Worker drill: three failed deliveries → delivery_exhausted → Retry work completed; no duplicate records.

30/30 labeled typed cases correct; five expected alerts, zero unexpected.

Synthetic data; no production accuracy claim.

Additional Details/Future Development (if any)

Delivered and demonstrated

Connected Drive → confirmed decision → Gemini fact → cited alert → impact graph → human review → brief → Docs export.

Clean staging deployment and worker recovery drill completed.

Current limits: synthetic data; dependency entry via API; native per-viewer Drive checks pending.

Next steps

- Native per-viewer Drive ACLs.
- Larger-scale retrieval and load testing.
- Jira, Chat and Gmail connectors.
- Shared Drives and portfolio views.

No customer impact, production scale or native document permission guarantee is claimed.

Submission links

- GitHub repository — public and available for evaluation
- Demo video — final submission cut, 3:25
- Cloud Run prototype — judge access must be verified

Repository	Public repository: github.com/steffy-lo/decision-radar
Demo video	3:25 English demo with captions; includes setup and recovery.
Open prototype	Homepage fixture available. Connected flow needs approved access.
